

„Sustainability for Generations“ is part of our GNS vision „Excellence for Nuclear“. Radiation and environmental protection, as well as the sustainable use of energy resources, are therefore fundamental components of our sustainable actions across all areas of the company. We are firmly committed to making our own value creation climate-neutral by the end of 2040.

Radiation protection for people and the environment

For more than 40 years, GNS Gesellschaft für Nuklear-Service mbH has been providing reliable and efficient solutions for safe and environmentally responsible disposal of waste and residual materials generated during the operation and decommissioning of nuclear power plants and nuclear facilities. The sustainable protection of people and the environment from hazards that can emanate from radioactive materials is always our top priority. We consistently pursue this goal in the development and manufacturing of our products as well as the planning and provision of our services.

Responsible resource management

The efficient use of natural resources and energy plays a central role in the value-added chain of GNS and, in particular, of its customers. In a continuous improvement process, we therefore optimize the environmental balance of our products and services with the ambition to make them climate-neutral by 2040.

To achieve this, we pay particular attention to resource-saving procurement, the selection of energy-efficient processes and the environmentally compatible disposal of waste at an early stage of our development, product planning and services, as well as our internal operating processes. In a constant dialog with our partners and suppliers, we work toward a climate-neutral and environmentally compatible design of their processes.

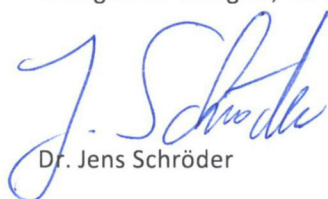

Developing and achieving common goals

GNS has an integrated management system based on ISO 9001, ISO 14001 and ISO 45001 that links the areas of quality, environment and occupational health and safety. They are integral parts of our corporate goals. The company's management is committed to the implementation and continuous improvement of an integrated energy management system in accordance with ISO 50001.

We can only achieve these goals together with all our employees. That's why we actively promote environmental awareness and involve them in the development and implementation of environmental and energy-related measures. Compliance with legal and other binding obligations is a fundamental principle of our actions.

Communicating openly

We regularly inform our employees, business partners, and the interested public about our environmental and energy-related activities and progress, and we seek open and constructive dialogue. In doing so, we create transparency and a common understanding.
