

CASTOR® V/19

Transport and Storage Cask
for Spent Fuel (PWR)

DESCRIPTION

The CASTOR® V/19 cask is designed for the transport and storage of spent fuel assemblies from pressurized water reactors (PWR).

The cask consists of a monolithic body [9] made of ductile cast iron, a basket [7] for accommodating the fuel assemblies and a double-lid system (primary [5] and secondary lid [2] arranged one above the other) as well as a protection plate [1].

On the outside wall, radial cooling fins are machined to improve the passive heat dissipation. The double-lid system made of stainless steel is tightly bolted to the cask body guaranteeing a safe long-term containment of the fuel assemblies. During interim storage the lid system consisting of the two barriers is permanently being monitored for leak-tightness. Monitoring is performed by a pressure switch [3] which is integrated in the secondary lid.

For neutron moderation, axial boreholes are drilled into the cask wall and filled with polyethylene moderator rods [8]. In addition, there are plates of polyethylene [4] at the bottom end and on the underside of the secondary lid.

At the bottom and lid end of the cask body, one pair of trunnions [6, 10] each is bolted for attachment of handling equipment. For transport on public routes the cask can be equipped with shock absorbers.

Excellence for Nuclear.

CASTOR® V/19

Transport and Storage Cask
for Spent Fuel (PWR)

LICENSES

The CASTOR® V/19 has the necessary licenses for transport, long-term interim storage as well as for handling in nuclear facilities.

The design complies with the international regulations from the IAEA (International Atomic Energy Agency) for type B(U)F package designs for the transport on public transport ways (roads, rail, shipping).

REFERENCES

Already more than 720 CASTOR® V-casks have been loaded and stored so far.

Nearly 450 CASTOR® V/19-casks have been loaded in German PWR sites such as Biblis, Brokdorf, Emsland, Grafenrheinfeld, Grohnde, Isar, Neckarwestheim, Philippsburg and Unterweser and are stored in their on-site interim storage facilities as well as in the interim storage facilities at Ahaus and Gorleben (GER).

Further CASTOR® V/19-casks were delivered to Switzerland and are stored there. In advance, the CASTOR® V/19 (CH) had undergone the approval revision and the revisions of the type approvals for storage in Switzerland.

TECHNICAL DATA

Cask Contents

Up to 19 spent fuel assemblies from PWR
(total length max. 4,950 mm, edge length max. 233 mm)

Total thermal power	39 kW
Total activity	1,900 PBq

Dimensions and Weight in the Storage Configuration

Overall height	594 cm
Outer diameter	244 cm
Cavity height	503 cm
Cavity diameter	148 cm
Cask weight empty	≈ 108 t
